

leading the way in Wales

From 1st January 2016, it will be a legal requirement for all new residential properties and dwellings built in Wales to have an automatic fire suppression system installed.

Is your company ready?

Vipond Fire Protection Ltd has been installing automatic fire suppression systems in residential and domestic properties for over 14 years.

Vipond Fire Protection Ltd is FIRAS and LPCB Level 4 approved and based in South Wales.

Vipond Fire Protection Ltd has the expertise and experience to guide you.

Every step of the way

We can provide a complete service including the design and procurement of all materials and equipment, installation, commissioning and certification of the completed, if compliant, system.

Llanelli

Supply

Once the completed sprinkler design has been approved by all interested parties we will source and deliver to site all of the necessary CPVC pipe, fittings, fixings and sprinkler heads to complete the installation. We will also supply GRP water tanks and electric sprinkler pumps if required.

Design

All design work will be produced in AutoCad by one of our fully trained in-house design team. Our designers will liaise with the client / M&E contractor to check that the proposed sprinkler head positions do not clash with any services to ensure that the sprinkler system is installed correctly - to plan - first time. The completed installation will provide sprinkler coverage to all required areas to meet the requirements of BS 9251:2014 Fire Sprinkler Systems for Residential and Domestic Occupancies - Code of Practice.

Consultation

We will assess each project individually and advise you on the most economic, compliant solution for the project together with the works in association you will need to undertake. If required, we will liaise with all interested parties to ensure their agreement of the proposed system. During this phase we will also advise on any design efficiencies that may be possible to reduce the overall cost of the project.

Wrexham

Alternative route

If you would prefer to carry out the installation works then we can provide your personnel with the necessary training and certification in the correct use of CPVC pipe installation. We will also undertake the design, supply, inspection (to ensure the system has been installed in accordance with the drawings), commissioning and certification of the completed system.

Pontypridd

Installation

We can undertake the complete installation of the sprinkler systems on your behalf.

Inspection

If your operatives undertake the installation one of our Site Supervisors will periodically visit site to check that the systems are being correctly installed in accordance with the design layouts.

Training

If required, we can arrange formal training for your operatives to ensure that they are competent to install CPVC pipework as part of a sprinkler installation. All operatives would be certificated to evidence their competency.

Commissioning

Following completion of the installation (either by us or your operatives) one of our Site Supervisors will visit site to witness test/ commission the system prior to final handover. At this point the relevant documentation will be issued for you to pass to the building owner/tenant in due course.

Maintenance

The sprinkler system must be maintained to ensure correct operation. If the owner/tenant places the maintenance contract with us, we will arrange to attend the property as and when required to check that the system is functioning correctly and that no cover plates have been painted over.
